2000 ARKANSAS SOYBEAN PERFORMANCE TESTS¹

D.G. Dombek, D.K. Ahrent, R.D. Bond, and I.L. Eldridge²

INTRODUCTION

Soybean cultivar performance tests are conducted each year in Arkansas by the University of Arkansas Division of Agriculture. The tests provide information to companies developing cultivars and/or marketing seed within the State, and aid the Arkansas Cooperative Extension Service in formulating cultivar recommendations for soybean producers.

The 2000 soybean cultivar performance tests were conducted at the Northeast Research and Extension Center (NEREC) at Keiser, the Cotton Branch Station (CBS) near Marianna, the Rice Research and Extension Center (RREC) near Stuttgart, the Southeast Research and Extension Center - Rohwer Division (SEREC-RD) near Rohwer, the Tracy McLelland Farm (TMF) near Gum Springs, and the Vegetable Substation (VSS) near Kibler. A test location map can be found inside the back cover.

METHODS

Soybean cultivars were entered by commercial seed companies and state and federal institutions. Recommended cultural practices were used at each location and all data were taken from a uniform set of instructions.

Cultivars were grouped by maturity groups based on information provided by the originating company or institution. To facilitate field operations, and to allow for fairer comparisons between cultivars, entries in the Group IV and V Commercial Cultivar Tests (CCT) were separated into “early”

¹ Use of products and trade names in this report does not constitute a guarantee or warranty of the products named and does not signify that those products are approved to the exclusion of comparable products.

² Research Associate and Research Specialists, respectively, Department of Crop, Soil, and Environmental Sciences, University of Arkansas, Fayetteville, AR 72701.

cultivars and “late” cultivars. Cultivars in the “early” Group IV test had a relative maturity range of 4.0 to 4.7 and in the Group V test, a range of 5.0 to 5.6. Cultivars in the “late” Group IV test had a relative maturity range of 4.8 or 4.9 and in the “late” Group V test, a range of 5.7 to 5.9.

Early planted tests (EPT) were established at NEREC, SEBS, TMF, and VSS. As with the CCT IVs and Vs, entries in the EPT were subdivided into “early” and “late” cultivars.

Within each test, entries were arranged as a randomized complete block design with three replications, with the exception of the EPT, which contained four replications. Plots in all tests were 4 or 5 rows wide depending on between-row spacing and 20 feet in length. Seeds were packaged for recommended planting rates and were planted with a cone planter. Specific location and cultural practice information accompanies each table.

Interior rows of each plot were harvested for yield determination after ends were trimmed. Percent moisture was recorded for all harvested seed of early-planted tests and plot weights were adjusted to thirteen percent moisture. Harvested seeds of all other tests were allowed to dry to uniform moisture before weighing, and weights were converted to yield in bushels per acre (bu/A).

Plots were visually rated for shattering and lodging. Shattering ratings were carried out on border rows according to the following scale:

1. No shattering
2. 1-3% shattered
3. 4-8% shattered
4. 9-19% shattered
5. 20% or more shattered

Lodging ratings were recorded on a scale from 1 to 5 based on the following criteria:

1. Almost all plants erect
2. Either all plants leaning slightly, or a few plants down
3. Either all plants leaning moderately, or 25-50% of the plants down

4. Either all plants leaning considerably, or 50-80% of the plants down
5. All plants down badly

Average plant height was recorded in inches for each plot.

Tests were established at the Main Experiment Station at Fayetteville on a Taloka silt loam soil to evaluate cultivar sensitivity to the herbicide propanil. Propanil was applied over-the-top of one-half of each plot at 0.75 lb active ingredient/A (0.25X recommended rate) when plants were in the V4 to V5 growth stage to simulate drift from rice fields. Plots were visually rated 7 and 21 days after propanil application, by Ms. Marilyn McClelland.

Cultivars were screened for tolerance to soil chloride in greenhouse tests conducted by Dr. J.D. Widick, ASU, Jonesboro.

¹ Keiser = Northeast Research & Extension Center
 Marianna = Cotton Branch Station
 Stuttgart = Rice Research & Extension Center
 Rohwer = Southeast Research & Extension Center- Rohwer Division
 Clark Co. = Tracy McLelland Farm, Clark Co.

² Because of abnormally hot and dry weather, the only nonirrigated test that will be reported is the “Early” MG4 test at Marianna.

³ The tests in Clark county were not irrigated based on 2 inch soil moisture deficit. Irrigation dates were: 7-27, 8-11, 8-18 and 9-01.

⁴ The MG5 and MG6 irrigated tests at Rohwer were planted and replanted but adequate stands were not achieved.

-- Strains were tested under irrigated conditions at Keiser and Rohwer only.

¹ Because of the abnormally hot and dry weather only the MG4 “early” test will be reported.

² The 1999 nonirrigated tests were not reported. Two- and three-year averages are based on 1998 and 2000 yields, and 1997, 1998 and 2000 yields respectively.

Table 8. Performance of Nonirrigated Soybean Cultivars, Cotton Branch Station, Marianna, AR, 2000¹, Continued.

Soil Series..... Calloway silt loam
 Previous Crop..... Soybean
 Row Width..... 38 inches
 Fertilizer Applied..... None
 Lime Applied None
 Planting Date..... 5-17-00
 Herbicide Application 1.5 pts./A Treflan, 5-18-00, 1 pt./A Storm, 6-02-00
 Irrigation Dates..... None
 Harvest Date..... MG 4 Early maturing cultivars: 9-15-00
